CHECKLIST

Project structure checklist: organising code from the start

- [ ] Sketch main responsibilities and create a folder for each before writing code
- [ ] Move configuration values into environment files or config modules
- [ ] Mark internal functions as private in every new module you create
- [ ] Place test files next to the modules they verify using a consistent naming pattern
- [ ] Draw a dependency graph showing which modules import from which
- [ ] Document folder structure and deviations from standard conventions at the repository root
- [ ] Review modules that change together frequently and consider merging them
- [ ] Expose only functions other modules need and keep implementation details hidden
